

STATIC PROGRESSIVE ELBOW ORTHOSIS

Extension

Flexion

The elbow orthosis utilizes the “Mackie Hinge” for use in the management of soft tissue flexion or extension contractures. It is easy to put on and take off. The joint has a removable knob for a lower profile fit and better patient compliance. The elbow orthosis is available in three pre-fabricated sizes, (small, medium and large), with a medial or lateral knob placement, custom to measurements, and custom to cast. A goniometer label to measure the desired angle is also available at your request.

- Bi-directional infinite angle settings in fractional increments
- Reduce chances of micro-tears to soft tissue and the inflammation they cause
- Increase flexion and extension range of motion
- Patient friendly for easy home use
- Lightweight with removable knobs
